lunarlogic

Company Mission & Identity Document — v4

The Lighthouse — our singular purpose, how we actually build, the clients we build for, and every boundary we operate within.

AI-POWERED CUSTOM ACCOUNTING AUTOMATION
Charlotte, NC

JONATHAN RODRIGUEZ
Founder & CEO
support@lunarlogic.ai

The Core Truth

> We build the accounting system your business needs — discovered through real conversation, not sold off a shelf.

That is the entire value proposition of LunarLogic reduced to its irreducible core. Not a product. Not a fixed suite of modules. Not "AR automation." A custom-built system, wrapped around the QuickBooks infrastructure that's already in place, that solves the specific workflow problem that's actually costing the client time and money.

Every business we work with, and every fractional CFO or bookkeeper's practice we work with, has a different bottleneck. For one it's AR sitting uncollected for 60 days. For another it's a month-end close that takes two weeks of manual spreadsheet work. For another it's a debt schedule tracked in a static Excel file that's already three months out of date, or a consolidation layer QuickBooks was never built to handle. We don't start with an answer. We start with discovery, find the real bottleneck, and build the specific thing that fixes it.

> **THE ONE SENTENCE**
>
> *"We find out what's actually broken in your accounting workflow, then we build the system that fixes it — inside the QuickBooks you already run."*

WHY THIS FRAMING IS EVERYTHING

A fixed product asks the market to fit the product. Custom-built solutions ask a different question entirely: what is this specific business or this specific practice actually losing time and money on right now? That question only gets answered through real discovery — a working session, a review of the current process, direct conversation with the person doing the work. LunarLogic is built around that discovery process, not around a pre-built menu.

The Founder's Conviction — Why LunarLogic Exists

As a consultant, I watched multinational corporations spend millions hiring people to study problems that technology had already solved. The implementations never stuck because the problems were systematic and operational — not solved by adding bodies. I saw the same gap at every level of the market. Technology was advancing faster than any organization knew how to absorb it. The small and mid-size businesses I wanted to serve had it worst — they had no consultant, no IT department, no pathway to implementation at all, and neither did the fractional CFOs and bookkeepers managing their books.

LunarLogic exists to close that gap, one client at a time, built around what that specific client actually needs — not a fixed roadmap of modules rolled out in a predetermined order.

THE FOUNDING INSIGHT

01 **Technology vs. Adoption.** The tools to modernize small business accounting have existed for years. QuickBooks, AI, workflow automation — none of this is new. What has not existed is a partner willing to sit down with a business or a bookkeeping practice, actually diagnose what's broken, and build a system that fixes that specific thing permanently.

02 **Bodies Cannot Fix Systems, and Neither Can a Fixed Product.** Hiring another staffer doesn't fix a broken close process. Buying an off-the-shelf tool doesn't fix it either if the tool wasn't built around how this business actually operates. The problem requires a system built for the actual workflow, not a generic capability the client has to configure themselves.

03 **The Gap Is the Opportunity.** The implementation gap between what's technically possible and what a $1M–$10M service business — or the practice managing its books — is actually experiencing is enormous, and it's been ignored by enterprise software vendors, consulting firms, and fixed-menu SaaS tools alike. LunarLogic was built specifically to close it, client by client.

Mission Statement

> LunarLogic builds custom accounting automation for QuickBooks-based businesses and the fractional CFOs and bookkeepers who manage their books — discovered through direct process analysis, built around the actual bottleneck, until the manual workarounds are gone.

There is no fixed phase-by-phase rollout. There is no "Phase 1, Phase 2, Phase 3" product roadmap. Every engagement starts with discovery. What gets built depends entirely on what discovery finds.

THREE OPERATING PRINCIPLES

01 **Discovery First, Always.** No proposal, no scope, no SOW gets written before we understand exactly what's broken and why. This isn't a sales step — it's the actual design phase of the build.

02 **Built Around the Client, Not a Menu.** Two clients with the same revenue and the same industry can need completely different systems. One needs AR automation. Another needs a month-end close workbook. Another needs both, plus a consolidation layer neither QuickBooks nor a generic tool can handle. We build to the discovery, not to a catalog.

03 **Built for Humans, Owned by the Client.** Automation eliminates the manual, repetitive, error-prone work — it does not replace judgment, and it never takes control away from the person responsible for the books. Every journal entry, every reconciliation, every adjustment is prepared for review and manual approval. LunarLogic never gets write access to a client's QuickBooks. That is a trust boundary, not a technical limitation.

How We Actually Build: The Discovery-First Model

LunarLogic does not sell modules off a shelf. Every engagement follows the same underlying process, regardless of what gets built at the end of it.

STAGE	WHAT HAPPENS
Discovery	Direct conversation and process walkthroughs with the person doing the work — often a fractional CFO or bookkeeper, sometimes the owner directly. We're not asking what they want built. We're asking what's actually broken, where the time goes, and where the current process is held together with spreadsheets and manual workarounds.
Diagnosis	We map the real bottleneck: is it collections, is it close, is it reconciliation, is it a reporting layer QuickBooks was never built to produce. Often it's more than one thing, and discovery is what surfaces the priority order.
Custom Scope	A scope and SOW built around exactly what was found — not a pre-set package. Pricing reflects the actual build, not a generic tier.
Build & Shadow Test	The system gets built, then runs in parallel with the client's existing manual process before it's trusted to run alone. Parallel testing is a standard, mutual commitment on every build.
Handoff, Never Takeover	The client retains full control. No standing write access to QuickBooks. Every output is prepared for review and manual posting. The system runs the repetitive work; the person stays the decision-maker.

A REAL EXAMPLE OF HOW THIS WORKS

A fractional accounting practice comes to us thinking they need help with cash flow forecasting. Discovery surfaces something different and more valuable: no native way to produce a consolidated, EBITDA-adjusted view across a client's entity structure — something QuickBooks can't do, and something the practice had tried to solve before with an off-the-shelf consolidation tool that never got fully implemented, because it didn't fit their actual workflow.

The build that comes out of that conversation isn't cash flow forecasting. It's a consolidation layer matched to the practice's specific chart of accounts, a debt reclassification workflow driven by an uploaded amortization schedule, and a review-and-approval workflow so the practice can eventually bring on staff without losing control of what gets posted. None of that was requested up front. All of it came out of one conversation about how the practice actually works. That is the model, every time.

The Problem We Solve

> QuickBooks is a general-purpose ledger, and every business or bookkeeping practice running on it eventually needs something specific that QuickBooks was never built to do natively — and right now, the only way to get it is a spreadsheet, a manual process, and someone remembering to do it every month.

COMMON PATTERNS WE SEE ACROSS DISCOVERY CONVERSATIONS

01 **No Dedicated Owner for the Broken Process.** Whether it's collections, reconciliation, or close, at the $1M–$10M level there's rarely one person who owns the process full-time. It runs on whoever has time that week.

02 **The Close Depends on One Person's Spreadsheet.** Month-end close, EBITDA adjustments, and consolidation are frequently held together by a single, manually maintained spreadsheet that only one person fully understands.

03 **Reconciliation Is Manual and Reactive.** Bank statements get matched to the ledger by hand, monthly, after the fact — instead of continuously.

04 **Debt and Schedule Tracking Lives Outside the Ledger.** Amortization schedules and debt splits are maintained in a separate file that has to be manually cross-referenced against QuickBooks, and frequently drifts out of sync.

05 **AR Still Runs on Memory.** Where AR is the bottleneck, it's the same story as always — no systematic follow-up, no real-time visibility.

06 **The Fractional CFO or Bookkeeper Is Absorbing All of It.** Whoever manages the books across one or more client entities is usually the one stitching all of the above together manually, every month, for every client — which is exactly why they are LunarLogic's highest-leverage partner and, often, buyer.

What We Build: Example Solution Categories

These are examples of what discovery has produced — not a fixed catalog. Every engagement is scoped to what's actually needed; a client may get one of these, several, or something entirely custom that isn't listed here.

CATEGORY	WHAT IT REPLACES
AR Automation — invoice automation, tiered payment reminders, AR aging dashboard	Manual invoicing, inconsistent follow-up, no real-time visibility into what's outstanding
Month-End Close Workbook — automated close package built around the client's actual chart of accounts	A close that depends on one person's memory and a spreadsheet rebuilt from scratch every month
Automated Bank Reconciliation — document-upload triggered reconciliation	Manual monthly matching against bank statements, discrepancies caught weeks late
EBITDA Adjustment & Consolidation Layer — consolidated, adjusted view across entities	Off-the-shelf consolidation tools that don't fit, or a manual spreadsheet consolidation redone every period
Debt Reclassification & Schedule Management — auto short/long-term splits from an uploaded amortization schedule	A static Excel debt schedule manually cross-checked against the ledger every month
Review & Approval Workflows — status tracking for growing practices	Informal, undocumented review that doesn't scale past one person
Cash Flow Forecasting — forward-looking visibility from actual ledger data	Guessing, or a forecast only as current as the last manual update

> *Every one of the above is built with the same standing constraint: LunarLogic never gets write access to a client's QuickBooks. Every journal entry, every reconciliation, every adjustment is prepared for review and manual posting by the person who owns the books.*

The Real Impact on the Business

The specific deliverable changes from client to client. What it unlocks does not.

PERSONAL

Whether it's a business owner or a fractional CFO managing five client entities, the same pattern shows up: hours lost every month to a manual process that shouldn't require a person doing it by hand. When that process is automated, the time gets redirected to the higher-value work only a person can actually do.

OPERATIONAL

A close that used to take two weeks and depend on one person's spreadsheet becomes something that can be reviewed and trusted on a predictable schedule. A debt schedule that used to drift out of sync stays current. Decisions get made on numbers that are actually right, not numbers that were right two weeks ago.

STRATEGIC

A fractional CFO or bookkeeping practice that has to rebuild the same manual process for every new client is structurally limited in how many clients it can take on. A business that can't close its books quickly can't make fast decisions. LunarLogic removes the manual ceiling so growth is limited by demand, not by how much spreadsheet work one person can absorb.

> *Success is measured in one currency: manual work that used to eat hours every month, gone — and the higher-value time it gives back.*

The Ideal Client Profile

LunarLogic has two connected buyer types, and both matter.

BUYER TYPE 1 — THE OWNER-OPERATED SERVICE BUSINESS

ATTRIBUTE	SPECIFICATION
Annual Revenue	$750K – $10M+
Business Type	Owner-operated service business
Accounting Platform	QuickBooks Online (required) or QuickBooks Desktop
AR / Accounting Staff	None dedicated — owner, office manager, or outside bookkeeper / fractional CFO handles it
Geography	Charlotte metro (primary) · nationwide for the right fit

BUYER TYPE 2 — THE FRACTIONAL CFO OR BOOKKEEPER

This buyer runs their own practice and manages the books for one or more client businesses on QuickBooks. They are frequently the highest-leverage relationship LunarLogic has: they see the bottleneck across every client they manage, and when LunarLogic builds something for their own practice, they own it, use it across their client base, and become a natural referral source. The buyer in this relationship is the practice, not the underlying client business. The practice pays, the practice owns the system, and the underlying client typically never needs to know the tool exists.

THE MINDSET PROFILE

- Technology is the correct answer to a broken manual process — not more staff, not more spreadsheets
- The way it's always been done is the problem, not the benchmark
- A system that runs without them personally is more valuable than one that depends on them
- Discovery is worth the time — a custom build that actually fits beats a generic tool that doesn't

Target Verticals & Partner Types

DIRECT CLIENT VERTICALS

Owner-operated, $750K–$10M, QuickBooks, no dedicated accounting staff:

- Commercial cleaning and janitorial
- Landscaping and lawn care
- HVAC, plumbing, and electrical
- Staffing and temporary labor
- Marketing and creative agencies
- IT managed service providers
- Commercial property maintenance

CHANNEL & PRACTICE PARTNERS

Fractional CFOs, bookkeepers, and QuickBooks ProAdvisors managing a book of QuickBooks clients in these same verticals. This is the primary go-to-market channel — a single practice relationship can surface multiple direct-client opportunities, and the practice itself is frequently a direct buyer for its own internal workflow.

> *A single practice relationship can surface multiple direct-client opportunities — and the practice itself is frequently a direct buyer for its own internal workflow.*

Why LunarLogic — Competitive Differentiation

ALTERNATIVE	WHAT IT OFFERS	WHERE IT FAILS
Do nothing	No cost, no disruption	The manual process keeps costing time and money every month
Hire staff	Human bandwidth	$40–55K/year, still manual, knowledge walks out the door when they do
Generic off-the-shelf tools	Capability	Built for a generic workflow, not this practice's actual process — frequently shopped, rarely fully implemented
Industry platforms	Integrated capability	Generic features, no calibration, nobody configures or runs it consistently
LunarLogic	A system built around the actual discovered bottleneck	Nothing — this is the point

THE FOUR PILLARS OF DIFFERENTIATION

01 **Discovered, Not Sold.** We don't lead with a product. We lead with a conversation, and the build comes out of what that conversation finds.

02 **Built Around QuickBooks, Not Competing With It.** No migration, no new platform, no retraining. We build what QuickBooks should be able to do but isn't.

03 **Custom to the Practice, Not Generic.** A close workbook or consolidation layer built around one practice's actual process, not a one-size tool the practice has to bend around.

04 **Never Takes Control.** No QuickBooks write access, ever. The client or practice stays the decision-maker on every entry. Trust is structural, not promised.

Who Is Not a Good Fit

DISQUALIFIERS

- **Point-of-sale businesses** — no invoice aging or manual accounting cycle to automate
- **Enterprise ERP users** (NetSuite, SAP, Oracle) — existing infrastructure and switching cost make the engagement unproductive
- **Non-owner, non-decision-maker requests** — someone who manages the books but can't actually approve a build
- **>30% insurance or government payer concentration** — requires compliance expertise outside LunarLogic's scope
- **Active financial distress** — no automation build fixes an insolvent business

PROBLEMS LUNARLOGIC DOES NOT SOLVE

- A broken sales pipeline — we fix accounting workflow, not revenue generation
- Below-market pricing or thin margins
- Client relationships already damaged by disputes
- A QuickBooks file too disorganized to build on — cleanup has to happen first
- Full CFO-level strategic decision-making — we build the infrastructure that makes good decisions possible, we don't make the decisions

Deployment Model & Pricing

FOUR STAGES

STAGE	TYPICAL TIMELINE	WHAT HAPPENS
Discovery	1–2 sessions	Direct process walkthrough with the person doing the work today. No proposal exists before this happens.
Custom Scope & SOW	Varies by build	A scope built to what discovery found, priced to the actual work — not a generic tier.
Build & Shadow Test	Varies by build	The system runs in parallel against the existing manual process before anything is trusted to run alone.
Full Production	Ongoing	The system runs; monthly recurring engagement covers ongoing operation, refinement, and support.

PRICING STRUCTURE

LunarLogic runs a monthly recurring model with a one-time implementation fee scoped to the build, not a percentage-of-recovery or usage-only model. Published tiers (Starter, Professional, Enterprise) reflect typical AR-first engagements by invoice volume; custom builds — close workbooks, consolidation layers, reconciliation systems — are scoped and quoted individually based on what discovery finds. Standard agreements run 12 months with a 90-day exit clause, and implementation carries a 90-day satisfaction refund.

> **INTERNAL NOTE — VERIFY BEFORE FINALIZING**
>
> *Double-check all pricing and contract terms above (tier structure, 12-month term, 90-day exit clause, 90-day satisfaction refund) against current actual contracts before this document is distributed.*

Company Values & The Businesses and Practices We Choose

HOW WE OPERATE

- We diagnose before we propose — no build starts without real discovery
- We build to the client, never to a menu
- We speak plainly — no jargon, no technology theater, no promises we can't measure
- We disqualify honestly — a bad-fit engagement is a disservice to everyone involved
- We never take write access to a client's QuickBooks — every entry is prepared for review, not posted automatically
- Parallel testing against the existing manual process is standard on every build, not an optional extra
- We measure success in one currency: manual work that used to eat hours every month, gone
- We practice what we preach — LunarLogic runs on LunarLogic

"Did we find the real bottleneck, and did we build the specific thing that fixes it?"

That is the only question every engagement, every conversation, and every build gets measured against.

This document is the lighthouse. When direction is unclear — on a client, on a partner relationship, on a build decision — come back here.
